WHAT IS MASTER KEYING?

MASTER KEYING IS A SYSTEM OF KEYS SET UP TO PLACE THE **SECURITY CONTROL** OF A BUILDING OR GROUP OF BUILDINGS UNDER THE JURISDICTION OF DESIGNATED INDIVIDUALS IN CHARGE.

WHAT ARE THE LEVELS OF CONTROL IN MASTER KEYING ?

A SUGGESTED GUIDE IN DETERMINING OR SELECTING THE PROPER LEVEL OF CONTROL

The following is a suggested guide in determining or selecting the proper level of control:

ONE LEVEL - CHANGE KEY

All locks operated by change keys only, and keyed different or alike as required,

Example: - Homes, Stores, etc.

TWO LEVELS - MASTER KEY

All locks operated by change keys and a MASTER KEY. Examples: Small Schools, Apartments, etc.

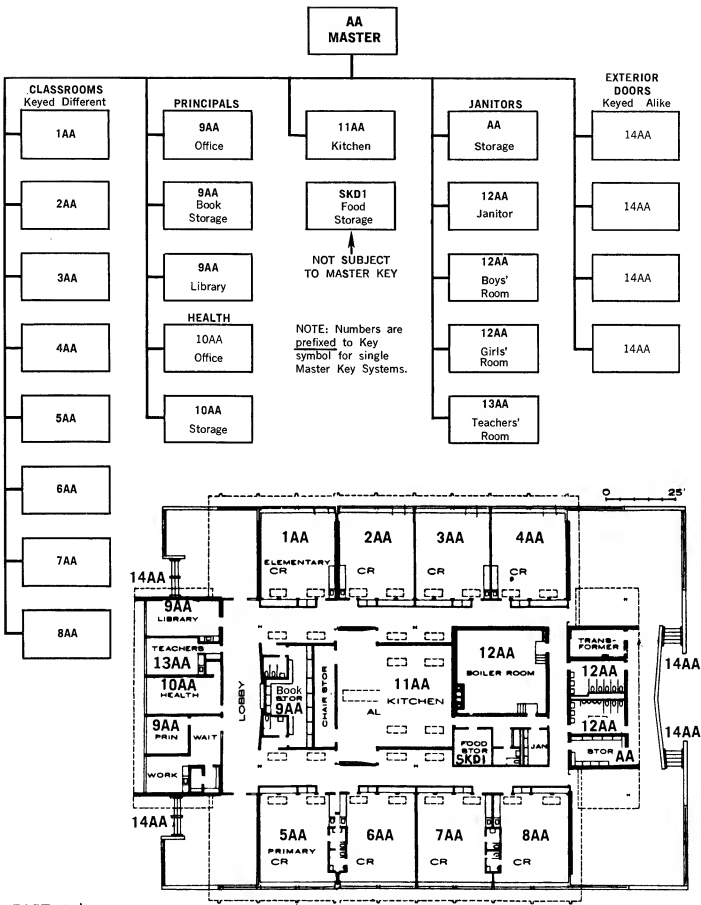

THREE LEVELS - GRAND MASTER KEY

All locks operated by change keys, master keys and a GRAND MASTER KEY. Examples: Office Buildings, Hospitals, etc.

FOUR LEVELS - GREAT GRAND MASTER KEY

All locks operated by change keys, master keys, grand master keys and a Great Grand Master Key. Examples: Colleges, Universities, Industrial Complexes.

MASTER KEY SYSTEM SCHOOL

HOW TO SCHEDULE KEYING - MASTER KEY SYSTEM

THE KEYING SHOWN ON THE OPPOSITE PAGE IS A SINGLE MASTER KEY SYSTEM.

THE FOLLOWING ILLUSTRATES HOW THE SYMBOLS SHOULD BE SHOWN ON YOUR HARDWARE SCHEDULE AND A BRIEF EXPLANATION OF THEIR MEANING:

THERE IS NO NEED TO EXPLAIN THESE KEYING SYMBOLS TO THE FACTORY AS EACH SYMBOL HAS A MEANING.

<u>KEY SYMBOL</u>	<u>QUANTITY</u>	<u>DESCRIPTION</u>
<u>HEADING #1</u>		
1AA THRU 8AA	8	DOORS — CORRIDOR FROM CLASSROOM
<u>HEADING #2</u>		
9AA	1	DOOR — WAITING ROOM TO PRINCIPAL
<u>HEADING #3</u>		
9AA	2	DOORS — LOBBY TO BOOK STORAGE
<u>HEADING #4</u>		
SKD1	1	DOOR — KITCHEN FROM FOOD STORAGE
<u>HEADING #5</u>		
AA	1	DOOR — CORRIDOR FROM EQUIPMENT STORAGE

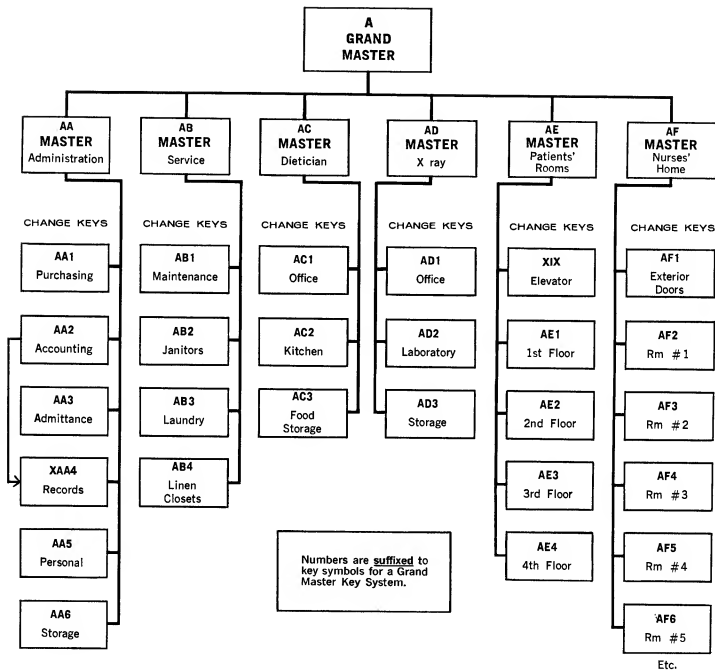

THE KEY SYMBOLS 1AA THRU 8AA FOR HEADING #1 INDICATES THAT THESE 8 DOORS ARE KEYED DIFFERENT AND SUBJECT TO THE MASTER KEY AA.

THE KEY SYMBOL 9AA FOR HEADINGS #2 AND #3 INDICATES THAT THE 3 DOORS ARE KEYED ALIKE AND SUBJECT TO MASTER KEY AA.

THE KEY SYMBOL SKD1 FOR HEADING #4 SIGNIFIES A SINGLE CHANGE KEY NOT SUBJECT TO THE MASTER KEY.

THE KEY SYMBOL AA FOR HEADING #5 INDICATES THAT THIS DOOR IS SUBJECT TO THE MASTER KEY AA ONLY NO CHANGE KEYS.

PHASE I

Levels of Control in Master Keying

The establishment of the proper level of control for a master key system is of paramount importance. Only when this has been determined, are you ready to lay out the system. One of the main reasons many master key systems are inadequate, is the fact that they were not established at the proper level when originally set up. The chart shown below will assist you in making this determination.

This key code system automatically indicates every key that operates in each cylinder. Key symbol AA1 indicates a lock operated by AA1 change key, AA Master and A Grand Master also Great Grand Master Key. The change key number is repeated for any alike cylinders. A different change key number is used for each keyed different cylinder such as AA2, AA3, AA4, etc.

Sub Master Keys:

In the case where sub-master keys are required in a grand or great grand master key system to sub-divide floor or department master keys, these keys can be setup as follows:

<u>Master Key</u>	<u>Sub Master</u>	<u>Change Keys Under Sub Master</u>
AA	AAA	AAA1, AAA2, etc.
	AAB	AAB1, AAB2, etc.
	AAC	AAC1, AAC2, etc.

KEY - CODE - SYSTEM

PHASE III

CROSS KEYING

Cross keying can be divided into two classifications:

1. Controlled cross keying.
2. Uncontrolled cross keying.

Controlled Cross Keying - is where two or more change keys under the same master key must operate one cylinder.

Uncontrolled Cross Keying is where two or more change keys under different master keys must operate one cylinder. Also, where two or more master or grand master keys must operate one cylinder.

These conditions should be eliminated as much as possible as they can greatly reduce the available changes and master keys in a keying system.

The key symbols established in Phase I & II of the Key - Code - System automatically indicates each change key, master key, grand master key, etc. that operates each cylinder. When cross keying is involved, the key symbol in itself, does not indicate all of the keys that operate each cylinder, therefore, another type of key symbol is required. These cross keyed sets must be prefixed with the letter, "X" and explain each of the different keys that must operate each set. List these cross keyed sets on the first page of the keying instructions.

The following are the two basic methods used in establishing key symbols for cross keyed sets.

Method I - (lock has individual change key).

XAA4 - operated by AA1, AA2, AA3, AA Master and A Grand Master.

Method II (lock does not have its own change key).

XIX - less keys operated by AA1, AA2, AA3, AA master and A grand master

X2X - " " " " AA1 thru AA25, AA master and A grand master.

QUESTIONS

I. What are the steps in pre-planning a keying system?

1. Study - understand and be able to explain the subject of masterkeying to the architect and/or owner.
2. Review the plans of the building or buildings.
3. Choose the proper level of control required.
4. Select a keying system which will cover the present and future requirements.
5. Present the system to the architect and owner at the keying meeting.
6. Record all changes to the system as agreed to at the keying meeting.
7. Mark plans with proper key symbol at each door opening on the side of the door where the key is to operate.
8. Present the owner with a schematic layout of the entire system showing the layout of the masters, grand masters, etc.

ADVANTAGES

II. What are some of the advantages of the Key - Code - System?

1. Uniform standardized method for setting up keying systems.
2. Allows continuity of the keying system from one order to the next.
3. The key symbol AAl, etc. automatically indicates all the keys that operate each cylinder.
4. Eliminates a lot of extra writing as the key symbol in itself fully explains the function and use of each key in the system.
5. Reduces the amount of crosskeying as it requires an "X" symbol whenever you deviate from standard keying system procedures based on the proper levels of control.
6. Allows the development of visual projected charts of the entire keying system.
7. Offers a method of projecting future keying requirements.
8. Allows better control of keys in the system.
9. Simple method of selling and explaining keying systems to a customer.
10. Allows the owner to fully understand and appreciate the keying system he has purchased.

Keying system #65, is an ideal plan for rekeying existing colleges and universities, that utilize the system to its maximum keying potential, yet is flexible enough to achieve the desired key control required. This flexibility is accomplished through the use of (7) keying variables. This system can be initiated on a new campus building and gradually rekey the entire campus when time and funds become available. In another case, the need may be such that this system be initiated on present buildings where key control is very poor.

1. The first step in explaining this system to a customer is to show the advantage of the Great Grand Master Key. This key is usually held only by the College President and Superintendent of Buildings & Grounds, and is used for Inspections, Tours and Emergencies.
2. The next step is to explain the advantages of establishing an Engineer's key. This key is (in effect, a limited great grand master) used by Maintenance men and operates only the mechanical rooms in all buildings. This key can be set up in any lock in the system to allow access through outside doors of each building to gain access to these mechanical rooms.

At the present time, many of these maintenance men are carrying a large ring of building masters, allowing them access not only to mechanical rooms, but every room including Private Office, Storage and Security areas in each building. If any of these building masters are lost, stolen or duplicated, the entire campus becomes vulnerable.

3. The third step in setting up this system is to assign the grand master keys. With the building layout plan of the campus, these grand master keys can be assigned by function such as Administration Boy's Dorms., Girl's Dorms., Athletic, School of Liberal Arts, School of Business Administration, etc.

Separate the Keyways for these various functions which will then allow you to expand each function in one Keyway.

4. The fourth step in setting up this system is to assign the master keys under each grand master key.
5. A complete study of the (7) Variables allowed in this system is necessary in order to achieve the maximum keying potential of the system, especially when rekeying old buildings which have the single plug cylinders. The master ring cylinder can be used in new buildings and special notice should be taken of the maximum regular (single plug) changes allowed when these cylinders must be mixed with master ring locks. We now have the master ring cylinder available on almost all of the locks we make and for template reasons, special care should be taken when ordering these locks for Exit Fixtures, Mortise Deadbolt Locks, etc.
6. Keying System #65 has a potential of 20,000 single plug key changes plus a maximum of 100,000 master ring key changes.

If you now have a college or university, Corbin Grand or Great Grand Master System in the 57 or 59 Series Keyways, request a large chart of this system. Keying System #65 removes much of the mystery in master keying by offering an organized plan which allows the school authorities to take an active part in setting up the keying system to meet their present and future needs.

REGULAR CYLINDERS

Any of the 288 masters can be sub-divided when required - into 3 sub-masters

EXAMPLE -

THE 12 MASTER KEYS UNDER ANY GRAND MASTER CAN BE REDUCED TO ONLY 4 MASTERS WHEN MORE THAN 64 CHANGES PER MASTER ARE REQUIRED, WHICH WILL THEN ALLOW 192 REGULAR CHANGES PER MASTER MAXIMUM.

EXAMPLE

192 Chgs per Master Max.

NOTES

Cross Out Remaining
8 Masters on Chart

GRAND

EXAMPLE

Any of the Above (4) Masters can be Sub-Divided into (3) Sub Masters with 16 Chgs. per Sub Master Max.

MASTER

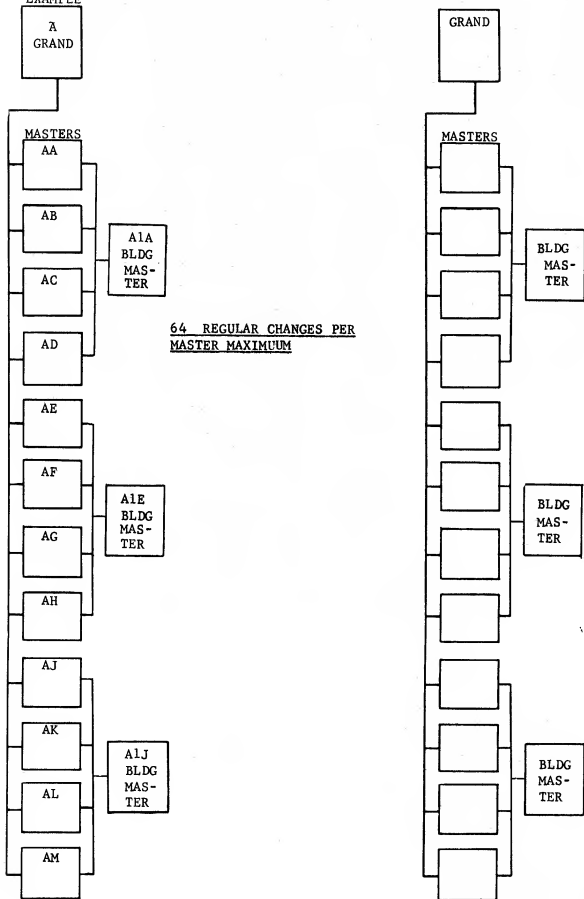

← Place over Master

REGULAR CYLINDERS

- 3 - Special building masters controlling (4) masters can be setup when required using regular type cylinders.

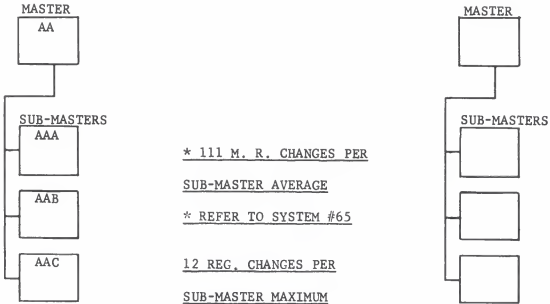

EXAMPLE

MASTER RING CYLINDERS

Any of the 288 masters can be sub-divided when required into 3 sub-masters.

EXAMPLE -

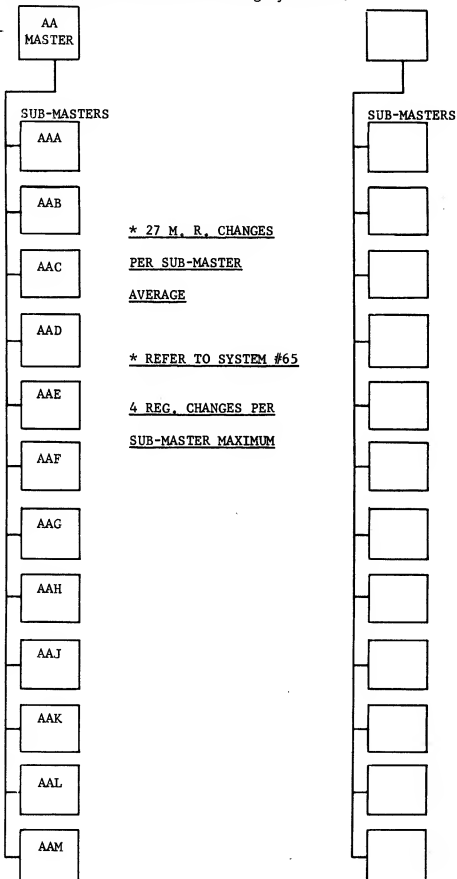

SYSTEM #65 - VARIABLE #5
MASTER RING CYLINDERS

Locks with Corbin Master Ring Cylinders offer maximum security & flexibility in masterkeying.

Any of the 288 masters listed can be "exploded" to equal one Grand & 12 masters where needed using locks with master ring cylinders.

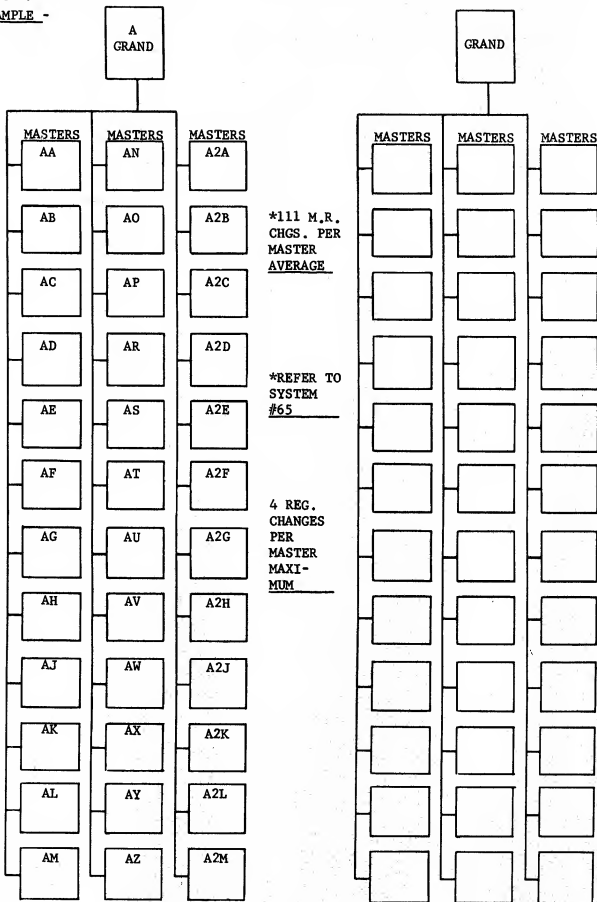

EXAMPLE -

SYSTEM #65 - VARIABLE #6
MASTER RING CYLINDER

36 Master keys can be set up under any Grand Master when required using Master Ring Cylinders.

EXAMPLE -

When Masters under the "GCM" only are required, cross out one Grand Master and use the (12) Masters listed.

SECTION B
GLOSSARY
OF
MASTER KEYING TERMS

Master Keying

A system of keys which are set up to place the control of a building or buildings in the individuals responsible for its security.

Master Key System

Single master key, with different change keys set up under this master key.

Grand Master Key System

Grand master key, with two or more master key systems set up under this grand master key.

Great Grand Master Key System

Great grand master key, with two or more grand master key systems set up under this great grand master key.

Types of Keys Used

Change Key

Single key that operates one lock, or group of locks, keyed alike, subject to this same change key.

Master Key

Single key that operates all locks that are keyed different or alike, under this master key.

Grand Master Key

Single key that operates all locks in a large group, which contain two or more individual master key groups, under this grand master key.

Great Grand Master Key

Single key that operates all locks in several large groups of locks, which contain, two or more individual grand master key groups, under this great grand master key.

Glossary of Master Keying Terms
Types of Keys Used

Construction Master Key

Single key that operates all locks, (subject to this key) during construction, but is canceled out, or made inoperative, when the owner's individual change keys are first used in these locks.

Engineer's Key - (Use key symbol "ENG" suffix (Eng.) where this key is to operate locks with other keys: AA26 (Eng.)

Single key that acts the same as a grand or great grand master key, to gain access through many different outside doors, etc., each under different master or grand master keys, in order to reach the room doors which contain electrical, heating, air-conditioning, plumbing and general maintenance areas. This key is a special key which eliminates cross keying, but must be set up at the inception of the system.

Maintenance Master Key

Single key that operates all locks in one or more areas controlled by maintenance supervisor, such as store rooms, janitor's closets, etc.

Maintenance Grand Master Key

Single key that operates all locks which contain two or more maintenance master key groups, under this maintenance grand master key.

Attendant's Key - (Use key symbol "ATT" suffix (Att.) where this key is to operate locks with other keys: AA26 (Att.)

Single key used by attendants in mental institutions, to operate patient's room locks in various buildings under many different master or grand master keys. This key is a special change key that eliminates cross keying, but must be set up at the inception of the system.

Privacy Key - (Use key symbol SKD1, SKD2, etc.)

Single key that operates one lock, or group of locks subject to this same change key, and is not subject to any of the master keys in the system.

This type key is used for food storage rooms, narcotic cabinets in hospitals, liquor storage rooms and bars in hotels, etc.

Hotel Keys

Guest Room Key

Single key that operates an individual room only, and in some cases a closet within this room.

Maids Master Key

Single key that operates a group of individually keyed guest rooms. This key may control all the rooms on one floor (floor master) or as many rooms as predetermined by the hotel management.

Limitations:

- A. Will not operate guest room when door is locked by guest from inside, or locked from outside by the display or emergency key.
- B. Will not operate guest room closet doors.

Laundry Change Key

Single key that operates all linen closets, and laundry chutes on all floors, and is used by laundry men for delivery and disposal of linen.

Laundry Master Key

Single key that operates all locks in laundry section, all linen closets and laundry chutes.

Steward's Master Key

Single key that operates all locks to doors in kitchen, dining rooms, banquet rooms and other doors as predetermined, by the hotel management.

Housekeeper's Key

Single key that acts the same as the hotel grand or great grand master key, and operates all guest rooms, display rooms, cleaning closets, linen closets and any other rooms under the housekeeper's control as predetermined by the hotel management.

Limitations:

- A. Will not operate guest rooms, when door is locked by guest from inside, or locked from outside by display or emergency key.
- B. Will not operate guest room closet doors.

Hotel Grand Master Key

Single key that operates all locks throughout the hotel, with the exception of privacy doors.

Limitations

- A. Will not operate guest rooms, when door is locked by guest from inside, or locked from outside by display or emergency key.

Hotel Great Grand Master Key

This key acts the same as a Hotel Grand Master Key, and used on larger hotels, where more than one grand master key system is set up under this great grand master key.

Limitations

Same as Hotel Grand Master Key.

Emergency Key

Special key that operates all guest rooms, display rooms, and is used in an emergency to unlock a guest room door, which has been locked from the inside, should a guest become ill, and can also be used as a lockout key to prevent all other keys from operating this room door.

Display Key

Special key that operates an individual room only, such as a display room, or permanent guest room. This key can lock and unlock this room door from the outside, and prevent all keys, with the exception of the emergency key from operating.

Control Key

Special key used to remove cylinder on key removable cylinders.

Special Master Key Terms

Keyed Alike

Two or more cylinders operated by the same change key.

Keyed Different

One or more cylinder keyed to different change keys.

Subject to Master Key Only

Cylinders set up to be operated by only the master key.

Subject to Grand Master Key Only

Cylinders set up to be operated by only the grand master key.

Subject to Great Grand Master Key Only

Cylinders set up to be operated by only the great grand master key.

Cylinders subject to Grand Master and Change Key Only

Cylinders set up to be operated by a change key and grand master key only.

Cylinders subject to Great Grand Master and Change Key Only

Cylinders set up to be operated by a change key and great grand master key only.

Controlled Crosskeying

Two or more change keys under one master key operating one cylinder.

Glossary of Master Keying Terms
Special Master Key Terms - cont.

Uncontrolled Crosskeying

Two or more change keys under different master keys operating one cylinder. Two or more master keys or grand master keys operating one cylinder.

Note: Uncontrolled crosskeying of change keys and master keys should be discouraged.

Technical Master Key Terms

Multiplex Master Keying

Method of enlarging a given master key system, by repeating the system on additional key sections. The keys in the first system will not enter the cylinders in the second section etc., because of the different shapes of the key warding. The grand master key can be milled special to enter all the different key sections as desired.

Split Pin Master Keying

This is accomplished by splitting the pins in the plug, and using small master split pins, to accomodate the different keys desired, such as change, master, grand master, etc.

Master Ring Master Keying

This is accomplished by a special master ring around the plug, which then allows only the change key in the plug, and the master keys in the ring. This is sometimes referred to as having two cylinders in one and it greatly increases the security of a master keyed cylinder, as well as allowing for considerably more available different change keys, master keys, etc., in larger keying systems.
